Repository Status: Individual Planning; project concept and partnership are not final.

1. My understanding of the Challenge

For this project I will need to design, build, test, and demonstrate a device controlled by a digital system such as an arduino or raspberry pi. This device needs to have something useful that it does and must include all five required functional categories. A strong project should have all its parts working together instead of having separate parts that do unrelated things. The device should also be made reliable, safe, well-built, and easy to understand.

2. Requirements and Constraints

The project must use an approved digital controller, and VEX V5 brains aren't allowed. It must include all five categories: output/display, manual input, automatic/sensor, actuators/mechanisms/hardware, and logic/processing/control.

The device must be integrated and work repeatedly. We can use lab materials, up to 250g of 3D-printing filament, and up to \$20 in purchased parts. The project should also be safe, organized, affordable, and presentable.

Important deadlines include the proposal, status checks, systems demonstration, documentation setup, engineering note book, poster, GitHub report, and final demonstration. Any outside code or circuits must be understood and properly cited.

3. Personal Readiness

- Wiring Circuits
- Understand C++ logic
- Soldering

- Coding
- Being on time
- Calculations
