

5. Current Front-Runner

My front-runner is the automatic bridge because it can use all 5 categories, is affordable, and gives me the chance to work on programming and mechanical design.

6. Anticipated Challenges

1. Challenge: Building the bridge mechanism,
Why: It needs to move smoothly.
Test: Build a small prototype.

2. Challenge: Sensor accuracy,
Why: It needs to detect when a "boat" approaches.
Test: Test the sensor at different distances.

3. Challenge: Programming
Why: All parts need to work together.
Test: Test each part separately first.

7. Individual or Partner Project

At this point I'm leaning towards working with a partner. I'm leaning towards working with someone because they might have strengths where I have my weak points, which will make the whole process a lot easier and I will be able to learn from it.

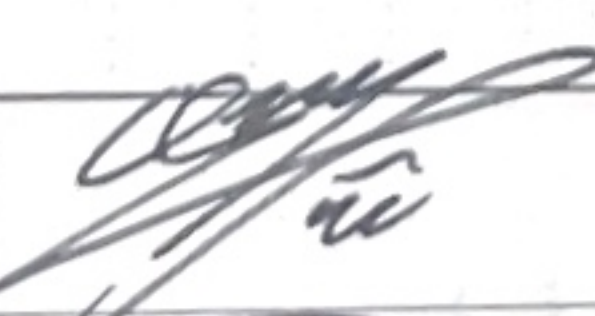

8. Questions and Clarifications

~~What if we use a~~

How many sensors can we use?

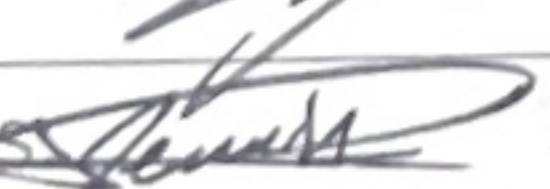

Is there a certain price we need to use?

How many people can work together?
